PROJECT PROPOSAL

INTRODUCTION -

The Animal Rescue And Stray Care Mobile Application is an Android-based Application designed to support animal rescue and welfare activities. It allows users to report injured and stray animals by submitting descriptions, photographs, and location details. The application also provide lost-found listing and adoption facilities User can access information about NGOs And Vetenary services. The project aims to promote animal welfare and make sharing animal related information easier and more convinient.

Objectives -

- To develop a user friendly Android application for animal reseue and welfare.
- To provide a facilities to user/report injured and abondent stray animals with photographs and location details.
- To facilitate sharing information about lost and found animals.
- To provide listing of animal avaible for adoption
- To provide information about NGOs and Vetenary services.

Purpose, Scope, and Applicability

The purpose of the Animal Rescue and Stray Care mobile application to provide a centerized digital platform for sharing information about that need help, animals that have been lost and found, and animals listed for adoption. It aims to make the process of reporting animal related issues more convinient and information improve access to relevent animals welfare information.

The scope of the project includes user-login and registration, animal report submission, photograph upload, lost-found listings, adoption listing, access predefine NGOs and vetenary services information the application uses Supabase for authentication, database operation and image storage, while Room Database supports local data storage.

The application is primerily intended for individuals, for animal lovers pet owners and people intrested in supporting animal welfare activities. It can also serve as an useful information-sharing tools for people seeking assistace for stray and injured animals.

SURVEY OF TECHNOLOGY

Mobile Applications provide an effective way to share information and access digital services. Kotlin and jetpack Compose are used for Android application development and user interface design. Supabase provides authentication database, and storage services, while Room database supports for local data storage. Android Studio is used to as the development platform/environment, and MVVM architecture helps organize the application code. These selected technology help develop a user-friendly application for animal reseue and stray care.

Proposed Technology to be Used

Front End	Kotlin and Jetpack Compose
Back End	Supabase (Authentication, PostgreSQL Database storage)
IDE	Android Studio
Frame Work	Jetpack Compose (MVVM Architecture)
Any other

ACKNOWLEDGEMENT

I acknowledge my deepest gratitude to my parents, who have been instrumental in shaping my life. I also acknowledge the guidance and inspiration received from all my teachers from KG to PG.

I express my sincere gratitude to our Principal Prof. (Dr.) Shaukat Ali. I also extend my gratitude to Dr. Hanif Lakdawala, Assist. Director Professional Courses. I would like to express my heartfelt gratitude to our coordinator, Dr. Ahtesham Shaikh, for his unwavering support and guidance throughout the duration of this project. His expertise, encouragement, and mentorship have played a crucial role in shaping the project's direction and ensuring its successful completion. I acknowledge the support provided by Prof. Shahid Pervez.

I am also thankful to staff members at our College and friends who have actively contributed to the project with their valuable insights and collaborative effort.

Mohammed Aaquib

DECLARATION

I hereby declare that the project entitled, "**ANIMAL RESCUE AND STRAY CARE MOBILE APPLICATION**" done at Anjuman-i-Islam's Akbar Peerbhoy College of Commerce and Economics, has not been in any case duplicated to submit to any other university for the award of any degree. To the best of my knowledge other than me, no one has submitted to any other university.

The project is done in partial fulfillment of the requirements for the award of degree of BACHELOR OF SCIENCE (INFORMATION TECHNOLOGY) to be submitted as final semester project as part of our curriculum.

Name and Signature of the Student

Mohammed Aaquib

CHAPTER 1
INTRODUCTION

1.1 BACKGROUND

Animals play an important role in maintaining ecological balance and contributing to the well-being of society. However, stray animals in urban areas often face several challenges, including road accidents, injuries, hunger, diseases, abandonment, and a lack of proper medical care. Many injured or distressed animals remain unnoticed because people do not have a convenient and organized way to report such cases and connect with individuals or organizations willing to help.

In many situations, people depend on informal communication methods such as telephone calls, messaging applications, social media posts, and personal contacts to seek assistance for animals. Although these methods can be useful, information may become scattered across different platforms. Details such as the animal's condition, location, photograph, and rescue status may not be maintained in one organized place. As a result, coordinating assistance and tracking reported cases can become difficult.

The widespread use of smartphones and mobile applications provides an opportunity to improve the way animal-related problems are reported and managed. A mobile application can provide a common platform through which users can submit reports, upload photographs, share location information, explore lost-and-found listings, view adoption information, and contact animal welfare organizations or veterinary services.

The Animal Rescue and Stray Care Mobile Application is developed to provide a convenient digital platform for reporting animal-related problems and accessing animal welfare information. The application aims to make the reporting process more organized and help users find relevant information through a simple mobile interface.

The application uses Kotlin and Jetpack Compose for Android user interface development. It follows the Model-View-ViewModel (MVVM) architectural pattern to separate interface-related responsibilities from application logic. Room Database provides local data storage, while Supabase provides cloud-based authentication, PostgreSQL database services, and image storage. OkHttp is used for HTTP communication with the backend.

The application is designed primarily for Android devices and focuses on providing essential animal welfare features through a single mobile application.

1.2 Problem Statement

The absence of a centralized and organized platform for reporting stray animal emergencies creates difficulties for individuals who want to help injured, abandoned, or lost animals.

The major problems identified are:

1. Animal-related complaints are often shared through different communication platforms.
